

Traps Guide

Chapter 2 The 4-Stage Model of Socratic Dialogue

Therapists ask so many questions, clients feel bombarded	60
Therapist asks good questions but does not know how to apply information to issues	70
Clients look to therapist for answers; therapist works harder and harder with little progress	76
Client asks for suggestions and replies to therapist's ideas with "Yes, but . . ."	76
Socratic dialogue does not help because it does not address central or maintaining beliefs/behaviors	89

Chapter 3 Guided Discovery for Depression and Suicide

Client is pessimistic and wants proof therapy will work	102
Client is too agitated to focus well	109
Clients display low energy; therapists skip steps and so dose of treatment is not helpful	114
Therapists become hopeless in the face of client hopelessness	128

Chapter 4 Guided Discovery with Anxiety

Client has high tolerance of uncertainty and the therapist offers reassurance	150
Example 1: Something terrible might happen	151
Example 2: What if? Needing to be sure	156
Example 3: Endless worry	159
Client has high perceived need for self-protection and seeks lots of advice and therapist gives it	164
Example 4: Taking a risk	165
Example 5: Four aspects of homework	167
Client is overly rigid; therapist inadvertently colludes by constructing tasks designed to be in control rather than helping client tolerate more flexibility	176
Example 6: Letting go of control	176
Therapist colludes with client avoidance for fear of being unkind	179
Therapist colludes with client avoidance due to fears the client's vulnerability might be real	181

Chapter 5 Imagery: The Language of Emotion

Client denies having images and the therapist does not enquire further	201
Therapist is anxious or uncertain how to work with imagery and so asks about images very lightly or refrains from asking at all	201

The client reports an image that evokes a variety of meanings and associations in the therapist’s mind; these intrude on the therapist’s processing of client reactions	214
Imagery evokes strong reactions and the client and/or therapist feel overwhelmed with emotion	215
The client reports several images and the therapist is not sure how to know which of the images are important to explore	218
The imagery involves smells, kinesthetic sensations, or other nonverbal content and the therapist is uncertain how to proceed	219
The therapist is pretty certain the imagery described did not really occur and yet the client has strong emotional reactions to it and cannot easily dismiss the image out of mind	225

Chapter 6 Inflexible Beliefs

Therapist continues therapy without a sound working alliance	251
Therapist doesn’t grasp the reasons for the client’s belief(s) or misses difficult-to-access beliefs, and persists in ineffectual therapy	264
Therapist and client go over the same issues, session after session, in repetitive ways	270
Therapist becomes hopeless	274
Client inflexible beliefs trigger therapist (unhelpful) inflexible beliefs	286

Chapter 7 Impulsive and Compulsive Behaviors

Not understanding the personal meaning of problem behaviors	292
Not appreciating the level of risk of serious harm to your client or to others	303
Underestimating the risk of relapse	305
Not appreciating your client’s fluctuating motivation and so neglecting to work on it	314
Overlooking the bigger picture: The wider world of your client	324
The negative consequences of change	328

Chapter 8 Guided Discovery with Adversity

Clients find it hard to accept that the cognitive model is relevant to their situation, especially the assumption that our thinking affects the degree of distress we experience. To them, the cognitive model appears to invalidate the seriousness of the problems they face	341
The client believes that either things have to be as they were or it’s not worth it	349
The therapist experiences a strong emotional reaction and is overwhelmed by their empathic reaction to the client	353
The therapist overemphasizes the “rational” aspects of cognitive therapy	354
The constraints of the adverse situation limit the opportunities for problem-focused and life-focused coping	360

A long history of adversity wears the client down and makes it hard for them to draw on constructive beliefs and experiences or to identify alternative possibilities 366

Chapter 9 Chasing Janus: Socratic Dialogue with Children and Adolescents

Child/Adolescent sees Socratic Dialogue as interrogation and/or attempts at control/coercion 374

Socratic Dialogue resembles an intellectual colloquy rather than an emotionally meaningful task 382

Children's tolerance for ambiguity, abstraction, and frustration is low and therapists struggle to handle this 394

Chapter 10 Socratic Dialogue in Group Therapy

A group member strongly expresses emotional needs, exhibits intense reactivity, or otherwise dominates group therapy time in a way that interferes with the group 427

There are large discrepancies among members in readiness or ability to engage in the therapy process: differing levels of motivation, homework adherence, participation, comprehension, or skill acquisition 431

Interactions among members become harsh, hostile, or result in conflicts that are potentially damaging and could lead to emotional withdrawal, clinical crises, or dropout. The therapist tries to control or cover over the conflict rather than using it as a learning opportunity 436

The therapist dominates the group through didactic presentations rather than actively engaging the participants 442

The therapist elicits group participation but then takes a laissez-faire approach in which they rely excessively or indiscriminately on participant interactions, providing too little guidance in the unfolding group dialogue 443

Chapter 11 Supervision and Therapist Beliefs

Education trap. Taking the expert position and instructing supervisees too much of the time: failing to get the balance right and thus failing to enhance learning 453

Neglecting therapist and supervisor assumptions 456

Losing sight of the bigger picture. Not thinking beyond the therapist and client 467

Neglecting the supervisory relationship. Failing to be sensitive to, respectful of, and consistently mindful of the need to maintain the working alliance between supervisor and supervisee 471
